In the last week we develop one of the first and most impressive applications of homological algebra to algebraic geometry: <u>dimension theory</u>. Our aim is to prove a theorem of Serre which characterises non-singularity of a point x an algebraic variety X in terms of the bifunctors

 $E_{xt_{R}^{n}}(-,-): (R\underline{Mod})^{\circ P_{x}} R\underline{Mod} \longrightarrow \underline{Ab}$

where $R = O_{x,x}$ is the ring of germs of regular functions on X at x. We begin with the basic theory of homological dimensions.

<u>Def</u>ⁿ Let R be a ving and M a nonzero left R-module. Let DM be the set of all integers $n \ge 0$ for which there exists an exact sequence

 $0 \longrightarrow P_{n} \longrightarrow P_{n-1} \longrightarrow \cdots \longrightarrow P_{l} \longrightarrow P_{n} \longrightarrow M \longrightarrow 0 \qquad (1.1)$

with all P_{c} projective. We call this a projective resolution of <u>length</u> n. We define the <u>projective dimension</u> of M to be the length of the shortest such resolution, if one exist, and ∞ otherwise:

$$pwj.dim_{\mathcal{R}}(M) := \begin{cases} \infty & D_{\mathcal{M}} = \phi \\ infD_{\mathcal{M}} & otherwise. \end{cases}$$

$$\begin{array}{l} \underline{Remarks} & (1) \ \mbox{We ref proj} \cdot \dim_{R}(0) = -1 \\ (2) \ \mbox{If } M \neq 0 \ \mbox{then } proj \cdot \dim_{R}(M) = 0 \iff M \ \mbox{is proj} \ \mbox{echive} \\ (3) \ \mbox{If } n \in \mathbb{D}_{M} \ \mbox{then } n + 1 \in \mathbb{D}_{M} \ \mbox{as we can make from } (1.1) \ \mbox{an exact sequence} \\ \hline 0 \longrightarrow P \longrightarrow P \oplus P_{n} \longrightarrow P_{n-1} \longrightarrow \cdots \ \mbox{for any projective } P \cdot \\ & \begin{pmatrix} 0 \\ 0 \end{pmatrix} & (0 \ \ \mbox{on}) \end{array}$$

Lemma (Dimension shifting) Given R-modules M, N and an exact sequence

$$O \longrightarrow K \longrightarrow P \longrightarrow M \longrightarrow O$$

with P projective, we have for all $n \ge 1$

$$\operatorname{Ext}_{R}^{n}(K,N) \cong \operatorname{Ext}_{R}^{n+1}(M,N) \qquad (2.1)$$

<u>Roof</u> From the long exact sequence for Ext we have for $n \ge 1$ a piece

$$\longrightarrow \operatorname{Ext}^{n}_{R}(P,N) \longrightarrow \operatorname{Ext}^{n}_{R}(K,N) \longrightarrow$$

 $(\mathsf{E}_{\mathsf{x}}\mathsf{f}_{\mathsf{R}}^{\mathsf{n}\mathsf{+}'}(\mathsf{M},\mathsf{N}) \longrightarrow \mathsf{E}_{\mathsf{x}}\mathsf{f}_{\mathsf{R}}^{\mathsf{n}\mathsf{+}'}(\mathsf{P},\mathsf{N}) \longrightarrow \cdots$

Since
$$\operatorname{Ext}^{n}_{R}(P,N) = 0$$
 for $n > 0$ we deduce (2.1).

Example Let R be a PID. As submodules of projectives are projective for PIDs, every R-module M has a projective resolution of length 1. Hence proj. $\dim_R M \leq 1$ for all M, and

$$p_{i} dim_{R} M = \begin{cases} -1 & \text{if } M = 0 \\ 0 & \text{if } M \text{ is } p_{i} e \text{-free} \\ 1 & \text{otherwise} \end{cases}$$

Example Let
$$R = k[x]/x^2$$
, and consider the projective resolution of $k = R/xR$,

 $\xrightarrow{\mathcal{X}} R \xrightarrow{\mathcal{X}} R \xrightarrow{\mathcal{X}} R \xrightarrow{\mathcal{X}} R \xrightarrow{\mathcal{X}} R \xrightarrow{\mathcal{X}} Q \xrightarrow{\mathcal$

We claim this module k has no finite projective resolution, so proj. dim. $R(k) = \infty$. How to justify this? Suppose to the contrary that k did have a finite projective resolution

2

$$0 \longrightarrow P_{n} \longrightarrow \cdots \longrightarrow P_{i} \longrightarrow P_{n} \longrightarrow k \longrightarrow 0 \quad (3.1)$$
Define $R_{i} = \operatorname{Ker}(\partial_{i} : P_{i} \longrightarrow P_{i-1})$ with $P_{i} = k$, so that we have exact requesion
$$0 \longrightarrow R_{n} \longrightarrow P_{n} \longrightarrow k \longrightarrow 0$$

$$0 \longrightarrow R_{i} \longrightarrow P_{n-1} \longrightarrow R_{n} \longrightarrow 0$$

$$\vdots$$

$$0 \longrightarrow R_{n-1} \longrightarrow P_{n-1} \longrightarrow R_{n-2} \longrightarrow 0$$
By dimension shifting we have for any module N and $m \ge 1$

$$0 = \operatorname{Ext}^{m}(R_{n-1}, N) \qquad (R_{n-1} = R_{n-1} \text{ is projective})$$

$$\cong \operatorname{Ext}^{m+n}(R_{n-2}, N) \qquad \textcircled{O}$$

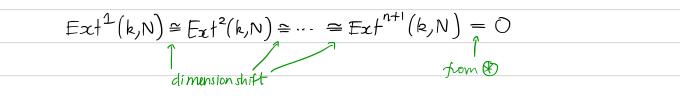

$$\cong \operatorname{Ext}^{m+n}(R_{n}, N) \qquad (P_{n-1} = R_{n-1} \longrightarrow P_{n-1} \longrightarrow R_{n-2} \longrightarrow 0$$

$$= \operatorname{Ext}^{m+n}(R_{n}, N) \qquad (P_{n-1} = R_{n-1} \longrightarrow P_{n-1} \longrightarrow R_{n-2} \longrightarrow 0$$

(3

But now consider (2.1), which is made up of short exact sequences of the form $0 \longrightarrow k \xrightarrow{g} R \longrightarrow k \longrightarrow 0$ where $g(1) = x \in R$.

From which we deduce, again by dimension shifting, that $E_{x}f^{m}(k,N) \cong E_{x}f^{m+1}(k,N)$ for any $m \gg 1$. But then we are led to a contradiction, since this would imply in particular,

which implies k is projective (which is false, for instance $0 \rightarrow k \rightarrow R \rightarrow k \rightarrow 0$ above is not split!). This contradiction proves proj.dime k = 00.

What we have done above in & didn't depend on k, so actually we have powen one direction in

Lemma The following are equivalent for an R-module M and
$$n \ge 0$$

(i) proj.dim_R(M) $\le n$
(ii) $\operatorname{Ext}_{R}^{i}(M, -) = 0$ for $i > n$
(iii) $\operatorname{Ext}_{R}^{i-1}(M, -) = 0$
Proof We have done (i)=(i). Suppose $\operatorname{Ext}_{R}^{n+1}(M, N) = 0$ for every R-module N,
and let $0 \longrightarrow K \longrightarrow \mathbb{R}_{-1} \longrightarrow \cdots \longrightarrow \mathbb{R}_{-} \longrightarrow M \longrightarrow 0$ be an exact sequence with
 \mathbb{R}^{i} projective and R arbitrary. Then by dimension shifting
 $\operatorname{Ext}_{R}^{4}(K, -) \cong \operatorname{Ext}_{R}^{n+1}(M, -) = 0$
as function, so K is projective and proj.dim_R(M) $\le n \cdot D$
Upshot We have for $M \neq 0$,
 $\operatorname{Proj.dim_{R}}(M) = \inf_{R}^{i} n f(n) = n f(M, -) = 0$

The Ext-characterisation of dimension is much easier to use:

Ex1 Use
$$E_{x}t_{R}^{i}(M \oplus M', N) \cong E_{x}t_{R}^{i}(M, N) \oplus E_{x}t_{R}^{i}(M', N)$$
 to prove that
proj_dim_{R}(M \oplus M') = sup{ proj_dim M, proj_dim M'}.

4

<u>Theorem</u> (Sewe) Let (A, m, k) be a nuetherian local ring. Then A is regular (i.e. non-singular) if and only if gl-dimA < ∞ , and in this case

gl.dimA = dimA
